Seminar

# Walking along an entire human chromosome at the nanoscale

## Irene Farabella

*The Armenise-Harvard Laboratory of Integrative Nuclear Architecture*

*Istituto Italiano di Tecnologia-IIT*

*Center for Human Technologies (CHT), Genova*

Recent advances in chromatin labelling, imaging and automated fluidics technologies have led to the development of chromatin tracing techniques, enabling direct mapping of the 3D chromatin folding *in situ* at the single-cell and single-molecule level. However, these techniques often pose challenges in post-processing and analysis. We implemented an ad-hoc library, Chromatin Imaging Analysis (CIMA), to speed up chromatin tracing analysis and quantification of chromatin organisation patterns. Here, we will show how utilising CIMA in conjugation with combinatorial barcoding allowed the first time to image the entire human chr19 at the nanoscale, unveiling heterogeneity in chromatin 3D spatial distribution and morphology

**Wednesday 27th November 2024**  
**02:30 PM**

**DBB, Jucci, Edificio Golgi-Spallanzani, Via Ferrata 9A**

HOST: F. Forneris
